

The only North American Passive House Foundation Package

The GEO-Passive Slab offers everything required for your passive home needs:

The GEO-Passive slab is a pre-engineered structural frost protected slab that can be used under most residences and buildings 3-stories and under in height. The behaviour of the slab also allows for the installation of your building on poor soils where conventional foundation systems are not adequate.

The slab can be fitted with a air-heated floor option to provide maximum comfort and reduced energy costs.

The continuous edge form eliminates thermal bridging and provides maximum air-tightness for your building envelope between the foundation and wall. There are no discontinuities between the foundation and wall which:

- Increases thermal comfort
- Reduces energy loss and
- Increases overall building occupant health.

Insulation thickness is tailored to your requirements for your Passive House.
