

Setting the Standard in Foundation / Heating Systems

www.legalett.ca

We support the building process from design to installation. In contrast to other heating systems, we design both the foundation and the heating system as a whole.

With our unique ability to eliminate frost walls without any chance of foundation movement, time and money are saved.

Engineered for Simplicity and Convenience

By simply using air to heat floors instead of water, LEGALETT radiant floors forever **eliminate the possibility of callbacks** and **damaging floods** due to water leaks.

LEGALETT also **eliminates** the complicated **manifold assemblies** that owners of hydronic (water-based) radiant floor systems often find difficult to operate.

Using LEGALETT for slab on grade radiant floors can **trim weeks from most residential and commercial construction schedules** because excavation and frost walls are not required with LEGALETT slab on grade radiant floors.

This also means that many building lots with poor soil conditions can now be cost-effectively developed.
