Reference: Miller Residence Construction 1996

To Whom it May Concern:

I just thought that it would be appropriate to forward feedback on the radiant floor which has now been installed and working flawlessly in our residence for four years. We are extremely pleased with its operation, Legalett Canada supplied the materials for our Legalett Foundation System which was part of a floating slab construction. The system is a frost-protected foundation which provides the heat for the ground floor of our cottage residence.

We have been living in our residence for four years and the Legalett Foundation System has provided a comfortable living environment. The floors are warm and there is no dampness in the floors. The temperature in the cottage is very stable and the slab retains the heat for long periods of time. In fact during the now famous ice storm of 1998 when we were without electricity for several weeks with an outside temperature about -10°C , the cottage heat loss was only about 1 degree per day.

The system is quiet with no significant air drafts. Since the floors are warm, we are able to maintain a lower air temperature thereby reducing the overall energy required to heat our residence. Minimal maintenance is required - none has been required so far.

We are pleased with our Legalett radiant heated floor foundation, its level of comfort and with the excellent knowledge and service provided by the legalett installer. In fact we would willingly recommend the same installation to others wishing that we had also used the same radiant floor technique on our residence main floor. i.e. we would willingly provide an unconditional recommendation of the Legalett system to others.

Please do not hesitate to contact us for any further reference at the above contact numbers.

Sincerely,

Regards Gordon Miller
