

The owner’s of this two-story Ottawa residence chose energy efficient and cost effective methods of construction for their family home, by using the Legalett air-heated “Slab on Grade” system and framing of the walls with 6” SIPS framing system.

The mechanical aspect consists of two Legalett water coil heaters, one which heats three independent zones, the other heats four independent zones. All zones controlled by means of programmable thermostats. Homeowner’s can choose to gang one or more zones together to reduce the number of thermostats.

Long term benefits of choosing the Legalett system:

- Quicker construction times (No footings required)
- Reduced heating costs (Storing heat into slab during Off-Peak hours)
- Warm floors and moisture-free interior (No basement)
